Significant Wind an

Overview

Preliminary information as of July 14, 2024.

Multiple rounds of thunderstorms led to widespread wind and hail damage across parts of Minnesota and Wisconsin on July 13 into the morning of July 14.

Scattered clusters of storms resulted in large hail over portions of east-central Minnesota during the afternoon on July 13. One storm produced a brief tornado in Rice County. A line of storms then developed over northwestern Minnesota during the evening and travelled southeast across central Minnesota throughout the night. This line led to numerous reports of hail and wind damage before it weakened as it moved into Wisconsin.

An unusually warm and humid air mass resulted in heat index values greater than 100F across portions of southern and western Minnesota during the afternoon and evening of July 13. The combination of several thunderstorms and persistent cloud cover kept heat index values in the low to mid 80s further east.

Map of severe storm reports on July 13 and 14. The most up to date list of reports can be found here.

Wind & Hail:

Widespread reports of wind damage and large hail occurred with the several rounds of thunderstorms from July 13 to 14. Some of the largest hail came out of a strong supercell that formed in eastern Minnesota during the afternoon of July 13, with reports of up to 3.5 inches in diameter. The line of storms overnight resulted in numerous downed branches and trees stretching from Alexandria to the Twin Cities, MN. Pockets of large hail were embedded within the line, with hail stones up to 4 inches in diameter reported near Monticello and Big Lake, MN.
